Arthur Koestler

But what if origin-tracing is not as hard as WHO's operatives are making out? What if it's just a smoke-screen for concealing the origin?

Arthur Koestler, an intellectual and adventurer, makes a great point in his 1964 book *The Act of Creation*. To paraphrase:

The idea that science is a boring pursuit that is impenetrable to the layman is a ***myth created by scientists to protect their own patch****. By surrounding science in this* ***fog of obscurity****, scientists seek to keep themselves at arm's length from the public,* ***avoid accountability****, and reinforce their own status*. (Chapter XI, Science and Emotion)

On the contrary, Koestler argues science is both *exciting* and *understandable*.

Using that as a starting point, let's take a look at what's involved in tracing the origin - it's not so complicated - in fact my guess is the CCP already knows. Dr. Daniel Lucey tends to agree:

They (CCP) have the capability, they have the resources and they have the motivation, so of course they've done the studies in animals and in humans. I think it's findable and I think it's quite possible it's already been found. But then the question arises, why hasn't it been disclosed?

I can answer that - coz the truth threatens the whole fabric of our expert driven top-down system? In China & the West.

Finding the origin is *not* theoretical astrophysics, despite what we're told. It doesn't involve complex mathematical equations to determine unverifiable outcomes. It's straightforward detective work dealing with real world details.

Here's what we know:

The closest relative to SARS-CoV-2 is RaTG13 at 96.2%, held at WIV. (Edit: since the time of writing a new candidate, BANAL-52 at 96.8% has emerged in Laos - an area from which WIV/EHA scientists collected viruses through the PREDICT program) (Remember, the virus discovered by Daszak and Batwoman (WIV-1) that was heralded as the *origin for SARS-1* was only fractionally higher at *nearly 97%*)

These related viruses only exists in a few locations in the world - notably the Mojiang mine/cave in Yunan - and WIV. Note: **None of them** are known to be contagious to humans without significant alterations.

Therefore, SARS-Cov-2 originated from Mojiang in Yunan, (or northern Laos), after undergoing significant evolutionary change via an intermediate species, namely pangolin - or - it was engineered at WIV.

Straight away that narrows the search down to a few key sites. We're getting close already.
